New Features Since Version 2.1

Asiva Shift+Gain 2.2 has replaced the HSV color space with the HSI color space. Although closely related to HSV, HSI has twice the bandwidth on the luminance or brightness channel as that of HSV. This change includes both the color space and individual channels you may operate on, and also the 3 Asiva® Maps where you draw curves to specify target colors to shift or gain.

New Features Since Version 2.0

Asiva Shift+Gain 2.1 features much improved curve drawing amongst other minor fixes.

New Features Since Version 1.x

Asiva Shift+Gain 2.0 has a major overhaul since version 1.0. Certain controls have been moved to more logical locations, such as the Amount Slider. New additions include edge-only capabilities, expansion or contraction of color-selected pixels and falloff control, opacity control, snapshot settings, quick curve settings, and the ability to overlay a specified color to see where color correction or color application will occur.

Please consult the User's Guide for details.
