

# Dockhand for Windows: What's New

## Dockhand for Windows 2.0 (Final Release, 2008-11-26)

- Dockhand is now a commercial application. If you find it useful, please consider purchasing a serial number.
- To encourage purchase, some features that worked in the beta will now only work in the purchased version. See the last section of the User's Guide for details.
- A couple of visual glitches on Vista have been fixed. While we still do not recommend using Vista, the program now looks better on it.

## Dockhand for Windows 2.0 Beta 3 (2008-09-28)

- The modifier key for keyboard shortcuts has changed from Alt to Control. This better conforms to Windows convention. It also better accommodates those running Windows inside a virtual machine under Mac OS X, where the Alt key is mapped to the Mac Option key and is not in an easily-accessible position.
- Related to the above, you must now hold down the Control key, instead of the Alt key, for two seconds to see the keyboard equivalents displayed.
- When the option to use Lucida Grande font is in effect, the program will now use the non-bold version of that font, instead of the bold version. This fits better with the overall appearance of Windows applications.
